

# Engineering and Manufacturing: Manufacturing, Processing and Control

T Level outline content: final version for ITT

**March 2020** 

## Contents

Introduction 3					
Outline content for T Levels:					
Core content:	6				
Occupational specialist content:	24				
- Manufacturing, processing and control: production technologies					
- Manufacturing, processing and control: manufacturing technologies					
- Manufacturing, processing and control: processing technologies					

- Manufacturing, processing and control: materials technologies

## Introduction

#### **Outline content**

This outline content has been produced by <u>T Level panels</u> of employers, professional bodies and providers, and is based on the same standards as those used for apprenticeships. The outline content will form the basis of the specifications for T Level Technical Qualifications, which will be developed by awarding organisations for approval by the Institute for Apprenticeships and Technical Education. One awarding organisation will be appointed to develop and deliver each Technical Qualification following a procurement process.

Colleges and other education and training providers will decide how to structure the T Level courses they offer, based on the qualification specifications. This will enable them to deliver the study programme's mandatory components in the most effective way for students.

A T Level programme consists of a Technical Qualification, substantial industry placement, English and maths, and other occupation-specific requirements where essential for entry to skilled employment. This outline content relates solely to the Technical Qualification part of a T Level programme.

To support progression to skilled employment and further study, the outline content for Engineering and Manufacturing includes a significant level of maths content. However, the admissions requirements of individual Higher Education institutions vary and may also require students to undertake an A level in maths or equivalent alongside their T Level. Additional funding is available to ensure providers are able to offer maths A level, or further maths alongside the T Level should they deem it appropriate to support student progression, and the T Level panel have recommended this is made available to students where appropriate.

A reference document has also been prepared by the T Level panel to provide further detail on the knowledge and skills that they would expect a student to develop as part of the T Level. This will be shared with the awarding organisation selected to deliver this T Level ahead of their direct engagement with the panels prior to milestone 1 of the contract.

Further information about T Levels is available on the website of the Institute for Apprenticeships and Technical Education here: <u>www.instituteforapprenticeships.org</u>, and at <u>www.education.gov.uk</u>.

## Engineering and Manufacturing route: Manufacturing, Processing and Control pathway

Awarding organisations will need to ensure that students have an up-to-date knowledge of the legal and regulatory obligations relating to employment in the occupations relevant to the T Level, and understand the practical implication of these on their work.

Maths, English and digital skills are set out in a separate annex. Awarding organisations should integrate these within the qualification so that they are applied in occupationally relevant contexts.

### **Core content**

The core content relates to the whole route 'route core', and the pathway that the Technical Qualification covers 'pathway core'. The core knowledge and understanding is assessed through an examination and core skills through a practical employer-set project.

The core knowledge and understanding focuses on the students' knowledge and understanding of contexts, concepts, theories and principles relevant to the T Level. This could include, where appropriate, assessment of knowledge and understanding relevant to the route and the pathway.

The employer-set project provides the opportunity to develop and apply a minimum range of core skills important for employability. The allocation of content to each type of assessment will need to be approved by the Institute for Apprenticeships and Technical Education.

#### Engineering and Manufacturing: core skills and workplace practices

The outline content for the T Level "Engineering and Manufacturing: Manufacturing, Processing and Control" confirms the knowledge, skills and behaviours which form the basis of its syllabus and its assessment requirements. The outline content will be designed and developed into a high-quality technical qualification by the awarding organisation that is awarded the licence for this T Level.

The outline content presents knowledge and skills statements across the different components based upon the intended assessment method (e.g. examinations; employer set project; occupational specialism assignments). It is important to recognise that the structure of the document does not illustrate intended course design, indicate recommended teaching and learning strategies, or imply that these components should be delivered discretely or even sequentially.

T Levels are intended to support flexible delivery models, and to increase the opportunities for centres and practitioners to work with their awarding organisation to determine how best to develop and deliver the knowledge and skills outlined, and to tailor programmes to meet the diverse needs of their students.

Engineering and Manufacturing T Level students must start to develop technical and practical skills from the beginning of their programmes, while becoming familiar with the

workplace practices that are essential to safe and effective engineering and manufacturing activities. The content specified is to be developed and secured through experience-led learning where possible, and students should begin to develop and apply fundamental knowledge and skills – using relevant tools and equipment – from the outset. These skills proficiencies, which will lead to defined "levels of competence" in the relevant occupational specialisms, must be developed in ways that reflect genuine workplace demands and world-class industry practices.

While the outline content defines the occupational specialist skills which will be acquired and developed by T Level students, it is important to recognise that these more advanced, specialist skills are underpinned by basic engineering and manufacturing skills and workplace practices, which form the foundation of operating safely and effectively in all engineering and manufacturing environments.

## Core knowledge and understanding across Engineering and Manufacturing Route

Element		Content
Working within the Engineering and Manufacturing Sectors	1.1	<ul> <li>Engineering and manufacturing design practices</li> <li>An understanding of: <ul> <li>Key principles, tools and methodologies in engineering and manufacturing design practice and processes;</li> <li>How materials, conditions and context influence engineering and manufacturing design processes and products;</li> <li>How user requirements are translated into engineering and manufacturing designs, i.e. inclusive design;</li> <li>How research and testing, and different research and testing methodologies, support effective design practices and outcomes.</li> </ul> </li> </ul>
	1.2	<ul> <li>Maintenance, installation and repair practices</li> <li>An understanding of: <ul> <li>The roles, functions and operations in this area of engineering and manufacturing practice, and how they relate to the sectors generally;</li> <li>The key principles, techniques and methodologies relevant to engineering and manufacturing maintenance, installation and repair;</li> <li>The tools and equipment used in maintenance, installation and repair;</li> <li>Key innovations, changing practices, and trends relevant to maintenance, installation and repair.</li> </ul> </li> </ul>
	1.3	<ul> <li>Manufacturing, processing and control practices</li> <li>An understanding of: <ul> <li>Key principles and practices that apply in manufacturing, processing and control;</li> <li>Key manufacturing, processing and control tools, equipment, infrastructure, systems and operations;</li> <li>The relationship between manufacturing, processing and control, and engineering design, and engineering maintenance, servicing, installation and repair.</li> </ul> </li> </ul>
Engineering and manufacturing past, present, and future	2.1	<ul> <li>An understanding of:</li> <li>Engineering and manufacturing from an historical perspective, including awareness of important technological advances across different sectors, and significant periods of change;</li> </ul>

		<ul> <li>Significant areas of innovation and emerging trends, and their implications for the sector, including artificial intelligence (AI), digitalisation, robotics, autonomous systems, distributed energy, new and smart materials, hybrid technologies;</li> <li>The influence, effects, and consequences of significant technological advances, and changing practices, in engineering and manufacturing, to include:         <ul> <li>Principles of sustainability, including product lifecycle, circular economy, exploring alternatives, renewables, waste and disposal.</li> </ul> </li> </ul>
Engineering representations	3.1	<ul> <li>Engineering drawings and graphical language</li> <li>An understanding of:</li> <li>How to accurately produce, interpret, and amend engineering representations, drawings, and graphical information (e.g. sketches, schematics, diagrams) in different contexts, using various techniques and relevant communications media;</li> <li>How best to calculate and apply the rules and principles of dimensioning, tolerancing and sizing within engineering and manufacturing contexts.</li> </ul>
Essential mathematics for engineering and manufacturing	4.1	<ul> <li>Mathematical theory and applications</li> <li>A Level 3 knowledge and understanding of mathematics for engineering and manufacturing, including: <ul> <li>Standard arithmetic:</li> <li>Ordering, intergers, fractions, decimals, percentages, ratios</li> <li>Algebra – transposing, factorising and quadratics, indices and standard forms <ul> <li>Including sequences and series,</li> <li>Problem solving involving growth and decay</li> </ul> </li> <li>Geometry including: <ul> <li>Calculation of areas and volumes of regular solids e.g. cylinders and spheres.</li> </ul> </li> <li>Graphs and charts, relevant to straightforward engineering and manufacturing contexts;</li> <li>Standard trigonometry including: <ul> <li>Pythagoras' theorem; circular measure; functions, sine and cosine rules; triangular measurement; graphs of trigonometric functions; logs (base 10 and natural);</li> <li>Common ergonomic identities; common ergonomic values;</li> <li>Applications of vectors including dot and cross product (in forces and motions, and alternating current);</li> <li>An understanding of moments (in mathematics and physics).</li> </ul> </li> </ul></li></ul>

	4.2	<ul> <li>Standard calculus including:         <ul> <li>An understanding of the use of basic calculus to solve defined engineering-based problems using differential and integral calculus;</li> </ul> </li> <li>Standard matrices and determinants including:         <ul> <li>Matrices and determinants for routine and non-routine operations;</li> </ul> </li> <li>Statistical analysis and probability relevant to fundamental engineering and manufacturing practices.</li> </ul>
	4.2	<ul> <li>An understanding of:</li> <li>Numbering systems and their applications e.g. decimal, binary, octal and hexadecimal.</li> </ul>
Essential science for engineering and manufacturing	5.1	<ul> <li>Scientific methods</li> <li>An understanding of standard international systems and units of measurement including: <ul> <li>The system of SI base quantities;</li> <li>The relationship between metric and imperial measures and methods for converting between these two systems;</li> <li>The nature (and differences) between scalars and vectors.</li> </ul> </li> <li>An understanding of scientific methods and effective approaches to scientific inquiry and research including: <ul> <li>The concept of the "scientific method";</li> </ul> </li> <li>Different methods, techniques, and models for scientific enquiry and research;</li> <li>How to analyse, evaluate, synthesise and apply information, data, research findings, deliberation, and the processes, results and outcomes of testing, modelling, and experimenting;</li> <li>The difference between accuracy, reliability and precision.</li> </ul> <li>Measurement <ul> <li>An understanding of:</li> <li>Techniques for making appropriate and accurate measurements along with use of a range of measurement instruments, technologies, tools and equipment.</li> </ul></li>

5.3	Chemical composition and behaviours
	<ul> <li>An understanding of:</li> <li>Atomic and chemical structures of matter including: <ul> <li>The structure, composition, interaction and taxonomy of matter i.e. elements, atoms, molecules and compounds; mixtures, solutions, suspensions and solubility; density; crystals; metals;</li> <li>Simple to complex chemical structures.</li> </ul> </li> <li>The principal behaviours and effects of chemical interactions in straightforward engineering and manufacturing contexts, including: <ul> <li>Atomic structure, including the three types, and how this relates to material property;</li> <li>How chemicals are used in electricity, including electrochemical cells, the simple cell, internal resistance of a cell, primary and secondary cells, cell capacity, electrolysis and electroplating;</li> <li>Common behaviours and effects of chemical reactions in engineering and manufacturing contexts, such as acidity and alkalinity, corrosion and corrosion resistance, material degradation, and potentially dangerous chemical reactions in high-risk operational and manufacturing contexts, and appropriate management and control of these substances;</li> <li>The nature and purpose of chemical interactions and reactions commonly used within engineering and manufacturing contexts, such as chemical etching, surface finishing, bonding, and applications for oils and lubricants;</li> <li>The relationship between chemical composition and material qualities (e.g. strength, ductility, weldability).</li> </ul></li></ul>

	5.4	Physical forces and behaviours
	5.4	<ul> <li>Physical forces and behaviours</li> <li>An understanding of: <ul> <li>Work, efficiency, energy, and power including:</li> <li>The basic terminology and concepts;</li> <li>Force, displacement and cause in "work";</li> <li>Mathematical equations for representing work and how the amount of work done by forces is calculated, negative work, and units of work;</li> <li>Potential, kinetic and mechanical energy including the interrelationship;</li> <li>Embodied energy.</li> </ul> </li> <li>The principal behaviours and effects of physical forces (static and dynamic) in straightforward engineering and manufacturing contexts including:</li> <li>Speed, velocity, acceleration, force, and mass;</li> <li>Forces acting at a point, linear and angular motion, linear momentum and impulse (and impulsive forces), the principles of conservation of energy and energy conversion, friction, effects of forces on materials, torque, forces acting within supported beams and structures.</li> </ul> A basic understanding of: <ul> <li>Fluid dynamics and general applications including flow, conditions of flow, viscosity, key differences between liquid and aerodynamics, gas flow, Bernoulli's principle;</li> <li>Thermodynamics and applications including heating and cooling, thermal expansion, heat transfers mechanisms, the four laws of thermodynamics, steam cycles, heat engines, gas cycles, ideal gas laws. An understanding of: <ul> <li>Effects of forces on materials including:</li> <li>Tensile force;</li> <li>Sheer force;</li> <li>Sheer force;</li> <li>Stress and strain;</li> </ul></li></ul>
		<ul> <li>Elasticity and elastic limit;</li> <li>Hooke's law.</li> </ul>
Materials and their properties	6.1	<ul> <li>An understanding of:</li> <li>The properties, structures, and classification of materials including: <ul> <li>Material structures, composition, and bonding in relation to (i.e.): metals (ferrous and non-ferrous), plastics, polymers, natural materials, and composites, and comparative evaluation of materials.</li> </ul> </li> <li>The selection (including rationale), applications and disposal requirements of materials, including:</li> </ul>

	1	
		<ul> <li>Mechanical, electrical, thermal, magnetic, optical, and deteriorative contexts, and applications;</li> <li>The nature, applications, and advantages of contemporary and smart materials.</li> <li>Material processing techniques and their effects on materials, including:         <ul> <li>Common methods of materials processing and their appropriateness to particular materials and contexts e.g. welding, joining, shaping, brazing, soldering, tempering, hardening, annealing, casting, moulding, sintering, forging, machining, ceramics, composites, wood, foam, smart materials, additive manufacturing, measuring and marking out;</li> <li>How different materials respond to processing e.g. ceramics, composites, wood, foam, smart materials, how these are managed, and materials testing methods and techniques (destructive and non-destructive), including:</li> <li>How materials degrade and fail, mitigation and prevention;</li> <li>How the condition of materials is identified, monitored, and maintained;</li> <li>The range of standard materials testing methods and relative advantages and disadvantages (e.g. tensile, hardness, ultrasonic, magnetic particle, disposal).</li> </ul> </li> </ul>
Mechanical principles	7.1	<ul> <li>An understanding of:</li> <li>The fundamentals of motion and mechanics (static and dynamic) underpinning engineering and manufacturing systems, including: <ul> <li>(Newtonian) 'laws of motion'; principles and laws relating to inertia, friction, momentum, and gravity; different types of forces (e.g. concurrent forces, non-concurrent co-planar force systems, and non-contact forces);</li> <li>Simply supported beams, including static equilibrium (and associated conditions), loading, load distribution, supported reactions; loaded components;</li> <li>Relevant laws and theories of motion and mechanics, and how they relate to forces and force systems.</li> </ul> </li> <li>Storage and transfer of forces and energy in operation, including: <ul> <li>Kinetic energy, principles and parameters, to include displacement, velocity and uniform linear acceleration;</li> <li>Dynamic parameters and principles; tractive effort, braking force, gravitational force, frictional resistance, momentum, mechanical work power,</li> </ul> </li> </ul>

		<ul> <li>Newton's laws of motion, D'Alembert's principle, principle of conservation of momentum, principle of conservation of energy;</li> <li>Practical examples of storage, potential and transfer of energy (e.g. fly wheels, springs, height, pressurised fluids);</li> <li>The range of power sources available across physical, mechanical, electrical, and renewable, including examples of solar, hydro, wind, electric motors, internal combustion, and steam;</li> <li>The operation of mechanical principles and systems.</li> </ul>
Electrical and electronic principles	8.1	<ul> <li>Electrical and electronic principles</li> <li>An understanding of: <ul> <li>The basic principles of electricity and electronics, including:</li> <li>The physical principles underpinning electrical and electronic systems and devices (e.g. basic atomic theory, structure and composition, energy, power, networks, charges, flow, force, current, capacitance, waves, conduction, magnetism, inductance, and standard units of measure).</li> </ul> </li> <li>The fundamentals of electric circuit theory and its applications including the coverage of: <ul> <li>Electricity, electronics, voltage, current, AC/DC, power, resistance, potential difference and dividers, basic electrical elements, Ohm and Kirchhoff's current and voltage laws;</li> <li>Use of Ohm's law to calculate parameters in series circuits, parallel circuits and mixed circuits;</li> <li>Calculation of current, voltage, and resistance, using circuit theory.</li> </ul> </li> <li>The basic principles of analogue and digital electronics and their applications, including: <ul> <li>The differences in signals used in transmission of information, usually electronic signals;</li> <li>Characteristics of analogue and digital signals, their definitions, waveforms, voltage and current values, fan in and fan out, signal conditioning, and relevant control systems;</li> <li>Examples and relevant technologies, waves, representations (e.g. block diagrams and bioteceptical designations).</li> </ul></li></ul>
		<ul> <li>hierarchical design), flexibilities, uses, memory, power and cost;</li> <li>Mathematical methods applied to signal processing.</li> <li>How to apply knowledge of theories, laws and relevant representations to investigate and solve straightforward problems relating to voltage, current, and resistance in engineering contexts (e.g.):</li> <li>Analysis of voltage and current in DC circuit networks comprising resistors, capacitors and</li> </ul>

		<ul> <li>inductors in series, parallel, and combined series parallel circuits;</li> <li>The relationship between voltage, current and power in AC circuits and represent them in graphs and phasor diagrams;</li> <li>The key electrical properties of semiconductor devices such as diodes operating in forward and reverse mode;</li> <li>High power electrical equipment and electronic devices, their specific issues and applications.</li> <li>Basic properties and principles of magnetism and their common applications in relevant engineering and</li> </ul>
		manufacturing contexts, for example, the relationship between flux density and field strength.
Mechatronics	9.1	<ul> <li>An understanding of the key components of integrated mechanical and electrical systems; their design, operation, and applications, including:</li> <li>The operation of electronic devices and circuits in mechatronic contexts;</li> <li>The operation, use and applications of programmable logic controllers, and the integration and application of mechatronic systems;</li> <li>The basic principles and applications of hydraulics and pneumatics in relevant contexts.</li> </ul>
Engineering and manufacturing control systems	10.1	<ul> <li>Control systems</li> <li>An understanding of: <ul> <li>Control system theory, including:</li> <li>Open and closed loop systems, including their functions and operation, applications, advantages and disadvantages;</li> <li>How control systems are represented in diagrams and their key features (e.g. input/output; transfer function; feedback; summing points) in different applications (e.g. electrical, pneumatic);</li> <li>The relationship between input and output (e.g. steady rate error);</li> <li>Feedback and performance in closed loop systems, including under or over-damped, and time dependency;</li> <li>A basic understanding of pulse width and amplitude modulation for control;</li> <li>The advantages and disadvantages of analogue and digital control systems;</li> <li>Measured parameters (e.g. pressure flow, temperature, speed, position);</li> <li>Industrial network systems;</li> <li>Requirements for networked systems in industry, including effective and efficient communication and data transmission.</li> </ul> </li> </ul>

		<ul> <li>An understanding of:</li> <li>How sensors and actuators are used in automation control systems, including: <ul> <li>The purpose and functions of sensors and actuators in control systems (e.g. position and volume of objects being processed; mechanised lifting and moving of objects);</li> <li>Types of sensors (e.g. analogue; digital; active; passive), their applications (e.g. switches; proximity sensors; laser; vision systems) and their measurement applications, including electrical, mechanical, thermal, chemical, biological, optical, acoustic and radiation;</li> <li>Types of actuators and applications, and different power sources.</li> </ul> </li> </ul>
Recognised standards in engineering and manufacturing	11.1	<ul> <li>Recognised engineering and manufacturing standards</li> <li>An understanding of: <ul> <li>The framework of relevant established engineering and engineering standards, for example:</li> <li>British Standards (BS) and International Organisation for Standardisation standards (ISO), in terms of range, purposes, and applications in engineering contexts; some awareness of other standards, in terms of types, jurisdictions (e.g. CE), content differences and purposes standards, symbols, conventions and annotations.</li> </ul> </li> <li>The authorities (e.g. Engineering Council), agencies and professional bodies (e.g. IET, IMechE, SOE,) responsible for established engineering and manufacturing standards, their roles and responsibilities;</li> <li>The purposes, value and applications of established engineering and manufacturing standards in engineering contexts including: <ul> <li>The intended effects of these standards on the quality and safety of goods, products, processes, people, and the environment.</li> </ul> </li> </ul>
Standard operating procedures (SOPs)	12.1	<ul> <li>An understanding of:</li> <li>Standard operating procedures, in terms of types, purposes, functions, value, and applications;</li> <li>How and why standard operating procedures are produced, implemented and evaluated in different contexts and for different purposes;</li> <li>How to access, interpret and comply with standard operating procedures.</li> </ul>

Health and safety	13.1	Health and safety principles, coverage, and legislation
principles and		
coverage		An understanding of:
		<ul> <li>Essential Health and Safety principles, practices,</li> </ul>
		and procedures which apply in engineering and
		manufacturing contexts, including:
		<ul> <li>The importance of Health and Safety practices</li> </ul>
		within the workplace;
		<ul> <li>The importance of mental health and wellbeing in the workplace;</li> </ul>
		<ul> <li>Potential risks and hazards in engineering and</li> </ul>
		manufacturing contexts e.g. equipment, tools;
		electricity, harmful substances including gases,
		environments; common industrial injuries that can
		occur without appropriate precautions
		<ul> <li>The importance of health and safety requirements and practices within high power electrical contexts,</li> </ul>
		across generation, distribution, isolation and
		storage;
		<ul> <li>How health and safety practices, legal requirements</li> </ul>
		and duties apply to different spheres and at different
		levels e.g. personal/individual, employee and
		employer obligations, local, national, and global
		requirements;
		<ul> <li>The health and safety issues, risks and practices</li> </ul>
		that apply generally to engineering and
		manufacturing workplaces (e.g. safe systems of
		work; fire safety, oxygen use in the workplace, fire
		and explosion hazards, manual handling), and an awareness that specific requirements and
		regulations apply in specialist areas (e.g. Chemicals,
		Electrical testing, Guarding, Asphyxiation hazards);
		<ul> <li>Effective risk and hazard management in different</li> </ul>
		workplace and engineering and manufacturing
		specific contexts;
		<ul> <li>Risk and hazard identification, and grading methods and procedures;</li> </ul>
		<ul> <li>Control measures (e.g. ERICPD, HAZOPS, HAZIDS)</li> </ul>
		<ul> <li>Key health and safety legislation, relevant</li> </ul>
		regulations, duties, and authorities, including how to
		access them, for example:
		<ul> <li>Health and Safety Executive (HSE);</li> </ul>
		<ul> <li>Reporting of Injuries, Diseases, and</li> </ul>
		Dangerous Occurrences 2013 (RIDDOR);
		Health and Safety at Work etc. Act 1974
		(HASAWA); Control of Substances
		Hazardous to Health regulations 2002
		(COSHH);
		<ul> <li>sector specific examples of relevant legislation, regulations, duties and</li> </ul>
		obligations.
	1	บมแหลแบทอ.

manayement		A general understanding of:
Stock and asset management	16.1	Stock and inventory management and control
Professional responsibilities, attitudes, and behaviours	15.1	<ul> <li>An understanding of:</li> <li>Professional conduct and responsibilities in the workplace (and in different engineering and manufacturing contexts), including those relating to: <ul> <li>An understanding of own role and responsibilities, relationship to others, organisational structure, accountabilities and inter-dependencies;</li> <li>Equality, access and inclusion.</li> </ul> </li> <li>"Human factors" within engineering and manufacturing contexts, including: <ul> <li>Human characteristics, capabilities and limitations;</li> <li>How design, performance and evaluation consider safety, comfort and productivity;</li> <li>Human performance, error, and error reduction tools and methodologies.</li> </ul> </li> <li>Reputation, ethics, personal, professional, and wider, responsibilities which apply in the workplace, in commercial settings, and in different engineering and manufacturing contexts;</li> <li>Continuous professional development (CPD) and professional recognition i.e. UK Spec.</li> </ul>
Business, commercial and financial awareness	14.1	<ul> <li>The principles and practices relating to environmental standards, legislation, regulations, compliance and wider sustainability issues, including waste disposal requirements and regulations.</li> <li>An understanding of:</li> <li>Basic commercial principles, contexts and operations, including: <ul> <li>Commercial priorities, principles relating to efficiency and "added value";</li> <li>Markets, customers/clients/partners and resource allocation.</li> </ul> </li> <li>Standard and emerging business and commercial practices, including: <ul> <li>Tendering and contracts and legal issues;</li> <li>Management practices, business models, staffing, training, development, research and innovation.</li> </ul> </li> <li>An understanding of: <ul> <li>Financial and economic concepts and terms relating to the management of money, sources of finance, transactions, revenue, cash flow, profit, costs, payments, assets, liabilities, solvency, financial responsibility, performance;</li> <li>Basic financial literacy e.g. budgets and recording financial transactions, business taxes and rates.</li> </ul> </li> </ul>

	1	
		<ul> <li>Stock and inventory management principles and practices including:         <ul> <li>The purpose of effective stock inventory management and control;</li> <li>Common models and their purposes.</li> </ul> </li> <li>Key issues, risks, advantages and disadvantages associated with different stock inventory management and control practices, including:         <ul> <li>Product life cycles, write down, redundant stock, obsolescence, and minimum stock levels; supply chain issues; packaging/storage (e.g. electro-static discharge).</li> </ul> </li> </ul>
		Asset management and control
		<ul> <li>An understanding of:</li> <li>Asset management principles and practices including: <ul> <li>Asset lifecycle management processes.</li> </ul> </li> <li>Key issues, risks, advantages and disadvantages associated with different asset management and budgetary control practices including: <ul> <li>Understand the asset "life cycle" and the "whole life" approach;</li> <li>Issues and requirements associated with the operation and maintenance of assets;</li> <li>The importance of asset management and budgetary control practices.</li> </ul> </li> </ul>
Quality assurance, control and improvement	17.1	<ul> <li>An understanding of:</li> <li>Quality in engineering and manufacturing developments, processes and activities, including: <ul> <li>The main principles, purposes and outcomes of quality assurance; quality control, inspection and testing; quality improvement systems, processes and practices;</li> <li>Workplace practices e.g. 6S methodology – "sort", "set in order", "shine", "standardise", "sustain" and "safety".</li> </ul> </li> </ul>
Continuous improvement	18.1	<ul> <li>An understanding of:</li> <li>The principles and practices of continuous improvement;</li> <li>Specific stages and methods for planning, implementing, monitoring and evidencing continuous improvement, including: <ul> <li>Reflection and evaluation of processes and practices, continual, incremental changes, improvements and refinements;</li> <li>Different methods for gathering feedback and evidence about performance;</li> </ul> </li> <li>Different approaches to continuous improvement including:</li> </ul>

		<ul> <li>Different methods and objectives appropriate to specific roles;</li> <li>Lean principles and practices;</li> <li>Management philosophies focused on continuous improvement (e.g. Six Sigma, Kaizen).</li> </ul>
Project and programme management	19.1	<ul> <li>An awareness of:</li> <li>How projects are defined, structured, reported on, and measured, according to standardised project management practices, protocols, processes and documentation;</li> <li>The roles, responsibilities, structure and management practices including external stakeholders and communication channels.</li> <li>An understanding of:</li> <li>Project planning, control methodologies and practices;</li> <li>Different organisational structures e.g. matrix working;</li> <li>Risk management;</li> <li>Budget, quality, cost and time;</li> <li>Collaborative project working practices and techniques, matrix working, management of interdependencies, and use of collaborative technologies.</li> </ul>

## Core knowledge and understanding across Manufacturing, Processing and Control pathway

Element		Content
Mechanical principles and systems in practice	P1	<ul> <li>Demonstrate understanding of fundamental mechanical principles, components, systems in practical and specialist manufacturing and processing contexts, including:</li> <li>Understand the operation of different mechanical principles and systems (e.g. how they manage forces, power and motion);</li> <li>Understand the fundamentals of common mechanisms and lifting machines, including how controllers maintain and control performance (e.g. governors, brakes, levers, gear boxes or torque converters);</li> <li>Understand key principles relating to the storage and transfer of energy in practical contexts;</li> <li>Understand key principles relating to static, dynamic, structural, and fluid loads in practical contexts; the effects of mechanical loadings on structures and components (e.g. weight, torque, fatigue, aerodynamics).</li> </ul>
Electrical and electronic principles and systems in practice	P2	<ul> <li>Demonstrate understanding of fundamental electrical and electronic principles, components, and systems in practical and specialist manufacturing and processing contexts, including:</li> <li>Understand the nature, behaviour and measurement of electricity in systems, the key characteristics of power flow analysis and its applications;</li> <li>Understand the construction and operation of standard power conversion systems;</li> <li>Know the components of electrical installations and their uses, including common failure modes and protection methods;</li> <li>Understand the properties and applications;</li> <li>Understand the properties and applications of different electrical circuits and their applications;</li> <li>Understand the main characteristics of standard electronic systems, components and their uses;</li> <li>Understand the purposes and applications of electronic sensing and measurement techniques and technologies.</li> </ul>

Planning, preparing and implementing manufacturing and processing activities	P3	<ul> <li>Demonstrate understanding of how to plan, prepare and implement manufacturing and processing activities, including:</li> <li>an understanding of how to analyse and interpret manufacturing and processing requirements, proposals and technical information to achieve specific outcomes;</li> <li>an understanding of how to plan and prepare manufacturing and processing activities by determining and specifying technical and resource requirements to achieve objectives;</li> <li>an understanding of how to produce manufacturing and processing plans;</li> <li>an understanding of different forms of supply e.g. sheet, bar, granules.</li> </ul>
Manufacturing, processing and control tools, techniques and practices	P4	<ul> <li>Demonstrate understanding of different manufacturing and processing tools, techniques and practices used in manufacturing and processing, including:</li> <li>An understanding of advanced tools and techniques used;</li> <li>an understanding of common materials processing techniques;</li> <li>a general understanding of the important techniques and processes used, including: assembly and fitting of components; common production techniques; joining techniques; casting and dyes; primary forming processes; common fabrication processes, welding techniques and practices; bonding techniques and practices; bonding techniques and practices; and machining tools, systems and processes;</li> <li>an understanding of computer aided manufacturing (CAM) (e.g. use of industrial robots and flexible manufacturing systems, CAD/CAM interfaces, using modelling to simulate manufacturing processes, interpreting component specifications and producing plans for CNC manufacture).</li> </ul>
Complex systems in manufacturing, processing and control	P5	<ul> <li>Demonstrate understanding of how complex engineering systems function in manufacturing and processing operations, including:</li> <li>an understanding of the operation and use of electronic devices and circuits;</li> <li>an understanding of electronic circuit design and manufacture; an understanding of the operation of control systems and programmable devices;</li> <li>an understanding of programmable logic controllers and automation in manufacturing and processing;</li> </ul>

		<ul> <li>an understanding of the operation of different engineering systems in manufacturing and processing operations (e.g. system diagrams, system control, system response);</li> <li>an understanding of the operation of electrical machines; an understanding of motors and drives (e.g. three-phase motors and drives, their load characteristics, rating and calculations, commissioning).</li> </ul>
Quality control,	P6	Demonstrate understanding of quality control, quality
quality		assurance and quality improvement principles and practices
assurance and		in manufacturing and processing operations, including:
quality		a on understanding of measuring matrology and testing in
improvement		<ul> <li>an understanding of measuring, metrology and testing in manufacturing and processing operations;</li> <li>an understanding of project management, monitoring and control in manufacturing and processing operations;</li> <li>an understanding of data analysis and processing (e.g. sourcing, interpreting, validating and recording data to monitor, review, record, validate and evaluate manufacturing and processing operations and performance);</li> <li>an understanding of evaluation and reporting processes;</li> <li>an understanding of quality assurance practices in manufacturing and processing operations;</li> <li>an understanding of continuous improvement techniques and practices in manufacturing and processing operations;</li> <li>an understanding of organisational efficiency;</li> <li>an understanding of business improvement techniques.</li> </ul>

### **Employer-set project**

The employer-set project ensures students have the opportunity to combine core knowledge and skills to develop a substantial piece of work in response to an employer-set brief. The employer-set project forms part of the Technical Qualification and is a separate part of the T Level programme to the Industry Placement.

To ensure consistency in project scope and demand, awarding organisations will develop assessment objectives, which require students to:

- plan their approach to meeting the brief
- apply core knowledge and skills as appropriate
- select relevant techniques and resources to meet the brief
- use maths, English and digital skills as appropriate
- realise a project outcome and review how well the outcome meets the brief

The awarding organisation will work with a relevant employer or employers, to devise a set brief that:

- ensures a motivating starting point for students' projects, for example, a real-world problem to solve
- ensures students can generate evidence that covers the assessment objectives
- is manageable for providers to deliver
- is officially approved by the awarding organisation and employer

By completing the project brief, learners will develop an appreciation of the breadth and diversity of Engineering and Manufacturing and have an opportunity to demonstrate highquality workplace practices, which allow them to work safely and effectively across different workplace contexts and contemporary workshop environments.

By achieving the assessment objectives and meeting the employer-set brief, students will demonstrate the following core skills to produce quality outcomes, using relevant technology, tools, equipment, systems and components:

#### Analyse and interpret an employer-set brief

• Evaluate and confirm the brief with reference to context, objectives and constraints (e.g. requirements, resources, precedents, technical issues, costs, health and safety, regulations, possibilities).

#### Plan and prepare suitable responses to the brief

• Propose, plan and prepare key activities, stages, methods, processes, techniques, documentation, tools, equipment and work areas, including risk assessments.

#### Develop response/s using key skills and processes

 Apply engineering and manufacturing processes and workshop practices to achieve specific objectives and to produce quality outcomes, using relevant techniques, tools, equipment and technology, within limits of own authority (i.e. a) multiple-component operational model, working artefact, or manufactured solution).

#### Evaluate and quality assure processes and outcomes

• Carry out investigations and tests on proposals, options, components and systems at relevant stages to gather and evaluate relevant evidence and data, and to confirm the suitability of plans, processes, actions and outcomes (including quality control and quality assurance activities).

#### Communicate and present outcomes and evidence

• Record, report, communicate and present plans, proposals, processes, issues, risks and outcomes to both technical and non-technical audiences, across a range of suitable formats and media (e.g. diagrams; physical and digital records; presentations).

## **Occupational Specialist Content**

Specialist content is structured into different occupational specialisms, which correspond to the apprenticeship standards listed on the relevant occupational map. Occupational specialisms ensure students develop the knowledge and skills necessary to achieve a level of competence needed to enter employment in the occupational specialism, and are organised around 'performance outcomes' that indicate what the student will be able to do, as a result of learning and applying the specified knowledge and skills.

#### Programme: Engineering and Manufacturing T Level

## Occupational Specialism: Manufacturing, processing and control (production technologies)

The specialism allows students to engage with the technical expertise, technology, methods, and skills involved in producing items (generally on an industrial scale), using specialist tools, equipment and machinery.

Students will examine a range of production processes, systems, and facilities, investigating factors such as scale, efficiency and demand, the application of quality management, and the analysis and optimisation of conditions, processes and practices when producing high-quality products for a variety of purposes.

Knowledge and skills have been taken from the following standards as a basis to create broad content that is intended to embrace existing and future technologies and apprenticeship standards: Engineering Technician, Engineering Fitter, Metal Fabricator, Non-Destructive Testing Engineering Technician, Pipe Welder, Plate Welder, Project Controls Technician.

**Performance outcome 1: Analyse** projects and specifications, considering the specific requirements, context, resources, tools and equipment, and the suitability of different production technologies, processes, and methods.

Knowledge specific to performance outcome	Skills specific to performance outcome
Scientific knowledge	Identify technical information and resources

estimation in practical production	Identify any potential issues, risks, and	
contexts.	areas for further analysis or investigation:	
Know how to carry out standard calculations in production contexts, using relevant aspects of arithmetic, algebra, geometry and statistics.	<ul> <li>Evaluate production requirements in terms of time, costs, resources, risks, management processes, and outcomes.</li> </ul>	
Understand how to apply trigonometry and standard calculus, matrices and determinants in context.	Analyse issues and problems with machinery, equipment, tools and material, proposing/implementing solutions, where appropriate:	
Understand standard component classification, numbering and referencing systems and how they apply to production contexts.	<ul> <li>Identify simple machine faults, their cause, and options for resolution (e.g. fast running; blunt tooling; burn marks; incorrect tool compensation).</li> </ul>	

**Performance outcome 2: Plan and prepare** relevant materials, resources, tools, and equipment needed to produce the relevant products and outcomes

Knowledge specific to performance outcome	Skills specific to performance outcome
Materials Understand the structure, composition, properties and classification of common materials used in production contexts. Understand the uses, applications and disposal requirements of materials. Understand characteristics relating to material quality and condition, how materials degrade and fail, and how these properties are monitored and maintained (e.g. identification; preventative techniques). Know the range of standard materials testing methods and techniques, their purposes, applications, and relative advantages and disadvantages. Understand materials processing techniques and their effects on materials.	<ul> <li>Safely prepare for relevant production tasks, projects or activities, identifying, anticipating, and addressing actual and potential issues and problems:</li> <li>Select appropriate materials, products and components to meet customer's needs.</li> <li>Prepare materials, resources, tools, equipment and other technologies, carrying out any risk assessments required, and other necessary checks (e.g. compliance, quality and function).</li> <li>Carry out routine and specialist maintenance of tools and equipment, in line with organisational guidelines.</li> <li>Outline, review and verify suitable plans and designs for production.</li> <li>Check and evaluate requirements (e.g. time, cost, resources, management, processes and outcomes) to help plan, organise and manage projects through relevant stages and to completion.</li> </ul>
Technical information Understand the purposes and types of standard technical documentation, including how to produce, interpret and amend them. Understand the representations, symbols, annotations and conventions used in engineering and manufacturing technical information.	<ul> <li>Review materials and evidence to inform planning and preparations, making appropriate decisions and changes where necessary:</li> <li>Suitable methods and work sequence.</li> <li>Use precedents and estimation to support planning.</li> <li>Check materials conform to grades and dimensions, as specified or detailed in relevant representations.</li> </ul>
Understand technical drawings, diagrams and representations (e.g. produce 3D model from 2D diagrams).	<b>Use relevant documentation,</b> records (e.g. health and safety), and schedules, to

confirm accuracy and feasibility with colleagues/stakeholders. Effectively set up and accurately use tools, equipment, machinery and other technologies, following relevant instructions and safety requirements:
<ul> <li>Set up, adjust, and accurately use relevant measuring, testing, diagnostic tools, rigs and equipment, confirming correct operating parameters.</li> <li>Correct set up equipment and technology for machining operations, including CNC machines (e.g. to cut, sand, bore, drill, create joints, mould and plane components) to meet production specifications.</li> <li>Measure and mark out components according to specifications and requirements, recognising, selecting and using most appropriate tools and equipment.</li> <li>Apply correct locking and securing methods and techniques.</li> </ul>
<b>Use correct methods for receiving,</b> <b>moving, handling</b> and preparing materials (e.g. consumables), resources, tools and equipment.
Plan appropriately for wastage, disposal, recyclability and sustainability in planned tasks, projects and activities (including consideration of costs).

**Performance outcome 3: Produce** relevant products and outcomes, considering the specified requirements, context and materials, using the relevant production technologies, methods, and processes.

Know how to use relevant digital and information and communication technology (ICT) to record, manage, store, and amend information, data and records (including using collaborative technologies) in production contexts.	
	<b>Accurately record</b> relevant technical information, data, risks and issues to support production projects, tasks and activities, at relevant stages.
	<b>Produce basic</b> engineering and manufacturing <b>representations and</b> <b>drawings,</b> and annotations, to support production processes.
	Monitor, amend and correct information, data, and communications at relevant stages, within limits of authority.
	<b>Support high-quality communications</b> in production activities by confirming information, requirements, expectations, plans, performance, and outcomes in ways that are suitable for purpose and context.

#### Programme: Engineering and Manufacturing T Level

#### Specialism: Manufacturing, processing and control (Manufacturing technologies)

The specialism allows students to engage with the technical expertise, technology, systems, methods, and skills involved in developing and making products at various scales, using specialist tools, equipment and machinery.

Students will examine a range of industrial processes, computer-aided manufacture, machining, manual techniques, research and planning required to develop raw materials and components into high-quality products, systems, and facilities, and to understand how these complex processes, practices and outcomes are evaluated and optimised.

Knowledge and skills have been taken from the following standards as a basis to create broad content that is intended to embrace existing and future technologies and apprenticeship standards: Boat Builder; Fashion and Textiles Pattern Cutter; Composites Technician; Advanced Furniture CNC Technician; Advanced Upholsterer; Bespoke Furniture Maker.

**Performance outcome 1: Analyse** projects and specifications, considering the specific requirements, context, resources, tools and equipment, and the suitability of different manufacturing technologies, processes, and methods.

equipment, people; and time management.

Understand the planning and preparation needed to carry out the manufacturing operations (e.g. obtaining the correct component drawings, material specification and data sheets including COSHH) to determine the manufacturing processes required and the sequence of operations.

# Mathematical knowledge

Understand how to use number systems, measurement techniques, and estimation in practical manufacturing contexts.

Know how to carry out standard calculations in manufacturing contexts, using relevant aspects of arithmetic, algebra, geometry and statistics.

Understand how to apply trigonometry and standard calculus, matrices and determinants in context.

Understand standard component classification, numbering and referencing systems and how they apply to manufacturing contexts.  Outline, review and verify concepts, plans and designs for manufacture.

**Identify any potential issues, risks,** and areas for further analysis or investigation, to inform processes and agreed outcomes and timeframes:

- Evaluate manufacturing requirements in terms of time, costs, resources, risks, management processes, and outcomes.

## Analyse issues and problems with manufacturing machinery, equipment, tools and materials, proposing and implementing solutions, where appropriate:

- Identifying simple machine faults, their cause and options for resolution (e.g. fast running, blunt tooling, burn marks, incorrect tool compensation). **Performance outcome 2: Plan and prepare** the relevant processes, tools, equipment, and resources, needed to manufacture relevant products and produce appropriate outcomes.

contexts.	

Understand the range and purposes of standard CAD and CAM systems and software in practical contexts.

Understand how to use CAD and CAM systems and software in manufacturing contexts, across multiple dimensions and collaboratively (e.g. standard features, functions, formats, program tools, techniques, operations and outputs).

# Machinery and technology

Understand the specific applications of different types of machines and technology used to manufacture products.

Understand the requirements for the calibration and testing of machinery and technology used in manufacturing.

Understand how to use machinery and technology used in the manufacturing environments (e.g. CNC machinery), to follow relevant guidelines and instructions, and to seek advice and guidance, where necessary.

## Workplace practices

Understand roles, responsibilities, functions and tasks in manufacturing workplace contexts, including limits of own authority and expertise.

Know how to carry out functions in accordance with standard workplace practices, with a particular focus on health and safety, standard engineering processes, hand and power tools and equipment, machinery and technology.

Understand the requirements and process for creating complex jigs and templates to meet manufacturing specifications and requirements. **Carry out drilling accurately** and consistently, with given tolerances, to meet specifications.

**Ensure that joins are suitably made and treated**, checking that joins are sealed and fit for purpose.

**Carry out relevant moulding and laying up** activities to support production.

**Fix and install** components, using the most appropriate method and material.

Manufacture new or replacement components to the required specification.

Effectively operate CNC machinery, using appropriate safety measures and guards.

**Prepare surfaces and apply suitable treatments**, ensure they are free from defects and protect them.

**Re-instate work areas** and equipment effectively, storing and maintaining tools and equipment appropriately.

Understand the properties, uses and limitations of a range of fixtures and fittings used in practical manufacturing contexts.

Understand relevant technical processes that support manufacturing activities, including capability, awareness of manufacturing procedures, defining operating procedures, the need for production scheduling and rescheduling, and how to resolve manufacturing production problems and breakdowns.

# Fault finding, diagnosis and resolution methods

Understand and use a range of basic, or first line, fault diagnosis and resolution methods (both quantitative and qualitative) in manufacturing contexts.

Understand basic fault detection and isolation methods in manufacturing contexts.

Know the limits of own authority and expertise, and how to seek advice, guidance, and relevant expertise and support, as necessary. **Performance outcome 4: Support the delivery (and management)** of relevant projects and activities, helping to **evaluate and review** processes and outcomes, and to improve practices.

## Programme: Engineering and Manufacturing T Level

#### Specialism: Manufacturing, processing and control (processing technologies)

The specialism considers chemical, physical, biological, and production processes, with students investigating process design, process operations, and process control in engineering and manufacturing. along with the principles which underpin contemporary processing technologies, practices, and outcomes.

Students will engage with the technical expertise, forces, technologies, methods, and skills involved in producing and delivering material changes in resources for specific purposes and applications across industry and society, and for designing, monitoring, operating and optimising these processes and technologies, using specialist and advanced tools, equipment and machinery.

Knowledge and skills have been taken from the following standards as a basis to create broad content that is intended to embrace existing and future technologies and apprenticeship standards: Advanced Baker; Food and Drink Advanced Process Operator; Science Manufacturing Technician.

**Performance outcome 1: Analyse** tasks, projects and specifications, considering the specific requirements, context, resources, tools and equipment, and the suitability of different technologies, methods and processes.

Knowledge specific to performance outcome	Skills specific to performance outcome
Scientific knowledge Understand the factors and forces that	<b>Identify</b> technical information and resources required for specific processing projects, tasks and activities
affect the composition, properties, and behaviours of materials, and their implications for processing, managing and exploiting these materials for	<b>Interpret and analyse</b> relevant technical information, data, representations and documentation

specific forces, chemistry, processing, and conditions, including temperature, pressure, compression, heat transfer,	tools and equipment Identify any potential issues, risks, and areas for further analysis or investigation.

fluid flow, gases, composition, blending, separation, distillation and purification.

Understand the operation of different mechanical principles and systems (e.g. how they manage forces, power and motion).

Understand the fundamentals of common mechanisms, lifting machines, and drive devices, and how controllers maintain and control performance (e.g. governors, brakes, levers, gear boxes or torque converters) for processing plant.

Understand the application of pneumatics and hydraulics as applied to various processing plant and machinery.

Understand fundamental electrical and electronic principles and systems in practical and processing contexts.

Understand the properties and applications of different electrical and electronic circuits and their application in processing plants.

Understand the purposes and applications of electronic sensing and measurement techniques and technologies, and specifically their function within contemporary continuous processing plants.

## Mathematical knowledge

Understand how to use number systems, measurement techniques, and estimation in practical processing contexts.

Know how to carry out standard calculations in processing contexts,

 Evaluate processing requirements in terms of time, costs, resources, risks, management processes, and outcomes.

Analyse issues and problems with process plant, machinery, equipment, instrumentation, and materials, proposing and implementing solutions, where appropriate:

 Identify simple machine faults, their cause, and options for resolution (e.g. fast running; blunt tooling; burn marks; incorrect tool compensation).

using relevant aspects of arithmetic
using relevant aspects of arithmetic,
algebra, geometry and statistics.
Understand how to apply trigonometry
and standard calculus, matrices and
determinants in context.
Understand standard component
classification, numbering and
referencing systems and how they apply
to production contexts.

**Performance outcome 2: Plan and prepare** the relevant tools, equipment and resources needed to process relevant materials and produce appropriate outcomes.

Knowledge specific to performance	Skills specific to performance outcome
outcome	
Materials Understand the structure, composition, properties and classification of common	<b>Safely prepare</b> for relevant processing tasks, identifying, anticipating and addressing potential issues and problems.
materials used in processing contexts. Understand the uses, applications and disposal requirements of materials in processing contexts.	<b>Check and evaluate requirements</b> (e.g. time, cost, resources, management, processes, and outcomes) to help plan, organise and manage processing activities through relevant stages and to completion.
Understand characteristics relating to material quality and condition, how materials degrade and fail, and how these properties are monitored and maintained (e.g. identification;	<b>Produce relevant documentation</b> , records (e.g. health and safety), schedules, confirming appropriateness and feasibility with colleagues/stakeholders.
preventative techniques). Know the range of standard materials testing methods and techniques, their purposes, applications, and relative advantages and disadvantages.	<b>Prepare</b> materials, tools and equipment, carrying out any risk assessments required and other preparatory checks (e.g. compliance, quality and function, pre-use safety):
Understand materials processing techniques and their effects on materials.	<ul> <li>Correctly prepare raw materials, processing equipment, and other technologies.</li> <li>Carry out routine and specialist maintenance of tools and equipment, in line with organisational guidelines.</li> </ul>
Understand the purposes and types of standard technical documentation, including how to produce, interpret and amend them.	<b>Effectively set up and accurately use</b> relevant measuring, testing and diagnostic tools and equipment.
Know the representations, symbols, annotations and conventions used in engineering and manufacturing technical information.	Accurately set and adjust plant and machinery operating parameters, following relevant instructions and safety requirements
	Check and measure materials according to specifications and requirements using

appropriate equipment (e.g. weighing food;

Understand technical drawings, diagrams and representations (e.g. produce 3D model from 2D diagrams).	measuring packaging; confirming proportions and composition).
	Use correct methods for receiving, moving, handling and preparing materials, resources, tools and equipment (e.g. raw
	materials; processing equipment). <b>Plan</b> appropriately <b>for wastage, disposal,</b> <b>recyclability and sustainability</b> in planned
	tasks, projects and activities (including consideration of costs).

**Performance outcome 3: Produce** the relevant product, process or outcome, considering the specified requirements, context, resources and materials, using suitable methods or processes.

## Programme: Engineering and Manufacturing T Level

#### Specialism: Manufacturing, processing and control (Materials technologies)

The specialism involves a range of industrial processes, research, testing, machining, computer-aided and manual techniques which are required to develop and use different materials in high-quality products, components, and systems, including new and smart materials.

Students will engage with the technical expertise, technology, methods, skills and techniques involved in producing, manipulating, processing, and refining the materials required for products, components and systems, using specialist tools, equipment and machinery.

Knowledge and skills have been taken from the following standards as a basis to create broad content that is intended to embrace existing and future technologies and apprenticeship standards: Metal Casting, Foundry and Patternmaking Technician; Paper Maker.

**Performance outcome 1: Analyse** the tasks, projects and specifications, considering the specific processing requirements, context, resources, materials, tools and equipment, and the suitability of different technologies, methods and processes.

Performance outcome 5: **Communicate** production information, proposals and solutions, **producing, recording and explaining** relevant technical information, representations, processes and outcomes.

Knowledge specific to performance outcome	Skills specific to performance outcome
Communication Understand how to communicate technical information and data in materials manufacture and processing contexts, including formal reports and analysis. Information technology and digital	Demonstrate effective communication, inter-personal skills and relationship management methods with different technical and non-technical audiences. Accurately record relevant technical information, data, risks and issues to support production projects, tasks and activities, at relevant stages.
Know how to use relevant digital and information and communication technology (ICT) to record, manage, store, and amend information, data and records (including using collaborative technologies) in materials manufacture and processing contexts.	<ul> <li>Produce basic engineering and manufacturing representations and drawings to support materials manufacture and processing activities:</li> <li>Provide detailed engineering and manufacturing representations where necessary.</li> <li>Monitor, amend, correct and report information, data, and communications at relevant stages, within limits of authority.</li> <li>Support high-quality communications, by confirming information, requirements,</li> </ul>
	expectations, plans, performance, and outcomes in ways appropriate to purpose and context.
